

Emirates to offer free Starlink Wi-Fi for its customers

- A Monitor Desk Report

Date: 17 November, 2025

Dubai: Emirates will deploy Starlink Wi-Fi across its entire in-service fleet, beginning with Boeing 777 aircraft in November 2025 and completing the rollout by mid-2027. The complimentary, ultra-fast service will deliver ground-quality internet at cruising altitude.

Starlink connectivity will enable Emirates customers to stream content, game, make calls, work, and browse social media throughout their journey on both seatback screens and personal devices simultaneously.

Emirates plans to install Starlink on all its in-service fleet – comprising 232 aircraft in the next two years. The airline has already equipped its first aircraft with Starlink on A6-EPF, the Boeing 777-300ER currently on display at the Dubai Airshow, where visitors can experience high-speed connectivity firsthand while on the ground.

The first Emirates commercial passenger flight with Starlink will depart

immediately following the Airshow as A6-EPF re-enters service, marking the start of an accelerated fleet-wide rollout.

The airline is primed to install two antennae on each Boeing 777 aircraft, and an industry-first three antennae on each Airbus A380, ensuring the highest levels of connectivity, capacity and coverage across every cabin class for a better customer experience.

The Starlink Wi-Fi service on Emirates will be free for all customers, across all cabins on Starlink-equipped aircraft.
